

# Calculation and Selection of Pressure Relief Controller

## Initial data

<b>10.00 m3/h</b>	Estimated water flow rate	<b>5.00 bar</b>	Water pressure before the regulator installation
<b>70 °C</b>	Maximum water temperature at the installation place	<b>1.00 bar</b>	Allowable pressure loss across controller
		<b>6.00 bar</b>	The pressure that will be maintained by the controller

## Calculation results

$[10.00 \text{ m3/h}] / [1.00 \text{ bar}]^{0.5} = 10.00 \text{ [m3/h]}$	Required Kv value
Tmax 70°C <= 70°C	There will be no cavitation on the controller
$( [G 10.00 \text{ m3/h}] / [Kvs 16,0 \text{ m3/h}] )^2 = 0.39 \text{ [bar]}$	Pressure drop across a fully open controller with Kvs=16,0 [m3/h] with flow rate 10.00 [m3/h]
$[10.00 \text{ m3/h}] / \{3600 * 3.14 * ([DN40] * 0.001)^2 * 0.25\} = 2.2 \text{ [m/s]}$	The flow rate is within normal limits $V < 3.0 \text{ [m/s]}$

## Selection result : Pressure relief controller

### Danfoss : AVA

Denmark

maintains the specified pressure at the input to the regulator

**opens when the inlet pressure increases**

normally closed

<b>DN 40 [mm]</b>	Nominal controller diameter
<b>Kvs 16,0 [m3/h]</b>	Flow coefficient
<b>PN 25 [bar]</b>	Nominal pressure
<b>dP 3.0...11.0 [bar]</b>	Pressure setting range
<b>dT 2 ... 150°C</b>	Operating temperature
<b>brass / cast iron</b>	Body material
<b>63 %</b>	The percentage of the opening of the controller gate at which Kv=10.00 [m3/h], and the pressure loss on the controller will be 1.00 [bar] when passing the calculated flow rate 10.00 [m3/h]
