

## D15P

### Pressure reducing valve with balanced seat Standard pattern

#### Product specification sheet

#### Construction

The pressure reducing valve comprises:

- Housing with PN16 flanges per ISO7005-2, EN1092-2
- Spring bonnet with adjustment screw
- Adjustment spring
- Valve system complete with diaphragm
- Pressure gauge

#### Materials

- Grey cast iron housing
- Cast iron spring bonnet
- Bronze valve seat
- Bronze piston guide
- Cone made of brass
- Spring steel adjustment spring
- EPDM diaphragm
- EPDM seal collar
- EPDM seals
- Stainless steel screws and nuts

#### Application

Pressure reducing valves of this type protect installations against excessive pressure from the supply. They can be used for household, industrial or commercial applications within the range of their specification.

By installing a pressure reducing valve, pressurisation damage is avoided and water consumption is reduced.

The set pressure is also maintained constant, even when there is wide inlet pressure fluctuation.

Reduction of the operating pressure and maintaining it at a constant level minimizes flow noise in the installation.

#### Special Features

- Non-rising stem for setting outlet pressure and position indicator on spring bonnet
- The adjustment spring is not in contact with the potable water
- With inlet and outlet pressure gauge
- Inlet pressure balancing - fluctuating inlet pressure does not influence outlet pressure
- Powder coated inside and outside - Powder used is physiologically and toxicologically safe
- Reliable and proven

#### Range of Application

Medium Water, compressed air\*, oil free compressed air\* and nitrogen\* in consideration of valid standards (e.g. DIN EN 12502)

Inlet pressure max. 16 bar

Outlet pressure 1.5 - 8 bar

#### Technical Data

Operating temperature max. 70°C

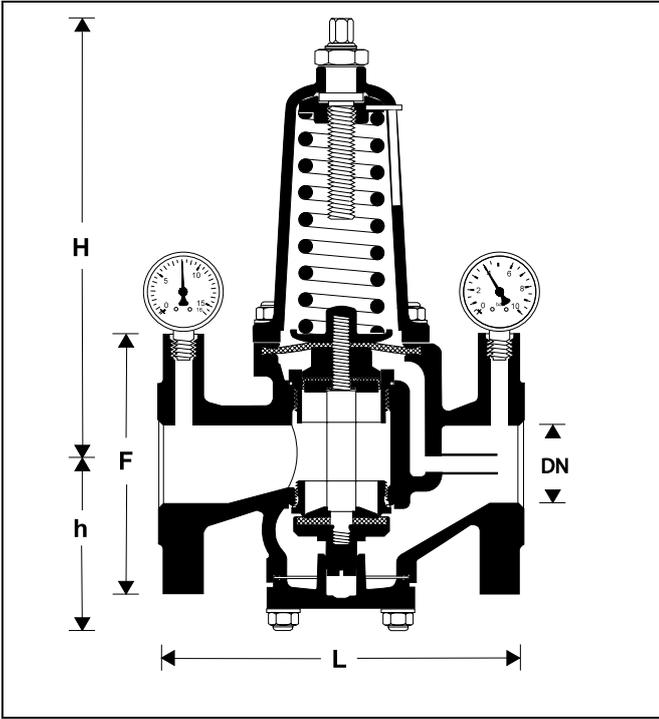

Nominal pressure PN16

Minimum pressure drop 1,0 bar

Diaphragm pressure max. 9,0 bar loading

Nominal size DN50

\* As part of an installation being approved according to PED requirements, this product must also be certified.

**Method of Operation**

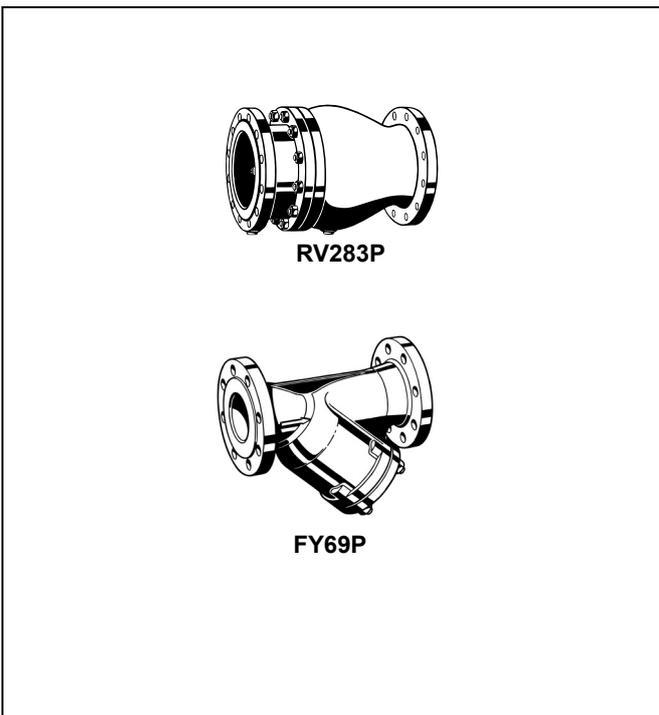

Spring loaded pressure reducing valves operate by means of a force equalising system. The force of a diaphragm operates against the force of an adjustment spring. If the outlet pressure and therefore diaphragm force fall because medium is drawn, the then greater force of the spring causes the valve to open. The outlet pressure then increases until the forces between the diaphragm and the spring are equal again.

The inlet pressure has no influence in either opening or closing of the valve. Because of this, inlet pressure fluctuation does not influence the outlet pressure, thus providing inlet pressure balancing.

**Options**

D15P-50A = With PN 16 flanged connections to ISO 7005-2, EN 1092-2 cast iron housing

Connection size	DN	50
Weight	approx. kg	16.2
Dimensions	mm	
	L	230
	H	282
	h	106
F	165	
K <sub>vs</sub> -value		28

**Accessories**

**RV283P Check valve**

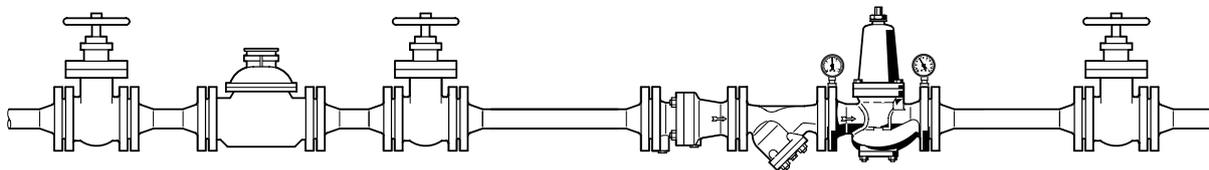

Grey cast iron housing, powder coated inside and outside. DIN/DVGW tested in compulsory test sizes DN 65, DN 80 and DN 100

**FY69P Strainer**

With double mesh, grey cast iron housing, powder coated inside and outside.

A = Mesh size approximately 0.5 mm

**Installation Example**

Connection size	DN	50
W*	mm	100

\* Minimum distance from wall to centre line of pipework

**Installation Guidelines**

- Install in horizontal pipework with spring bonnet directed upwards
- Install shutoff valves
- The installation location should be protected against frost and be easily accessible
  - o Pressure gauge can be read off easily
  - o Simplified maintenance and cleaning
- Install downstream of the filter or strainer
  - o This position ensures optimum protection for the pressure reducing valve against dirt
- Provide a straight section of pipework of at least five times the nominal valve size after the pressure reducing valve (in accordance with EN806-2)

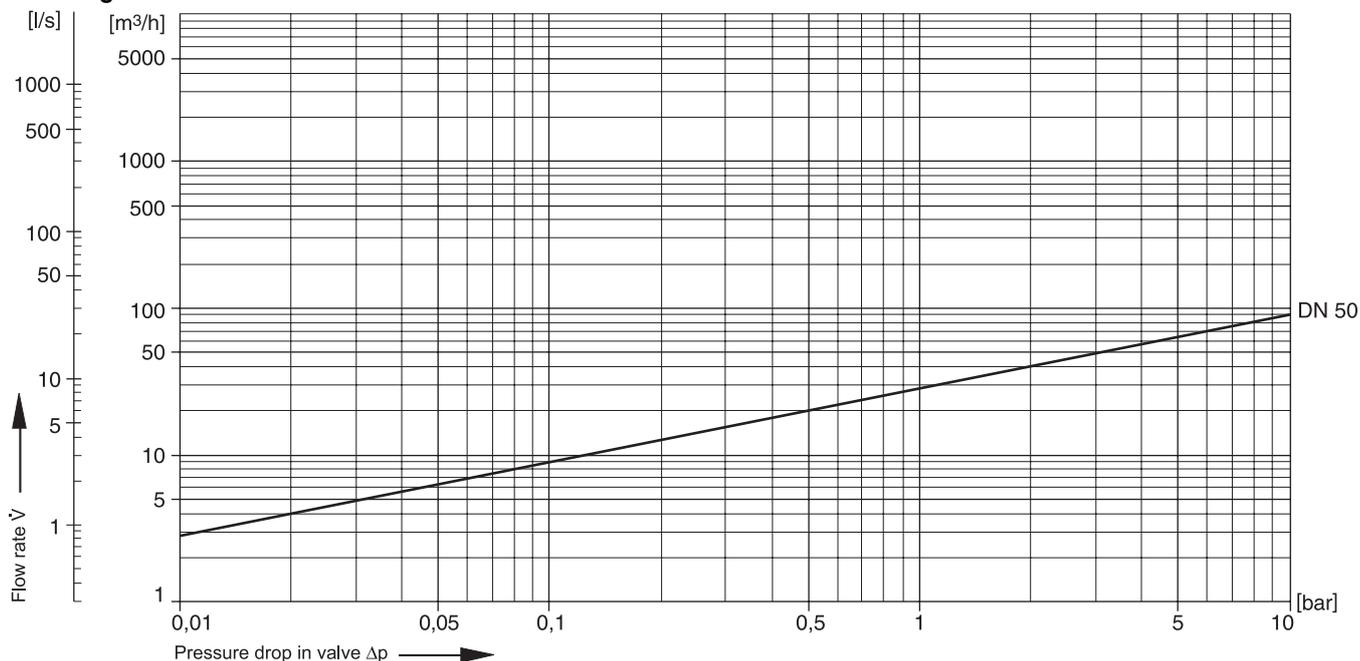

**Typical Applications**

Pressure reducing valves of this type are suitable for multi dwelling buildings, industrial and commercial applications within the range of their specifications.

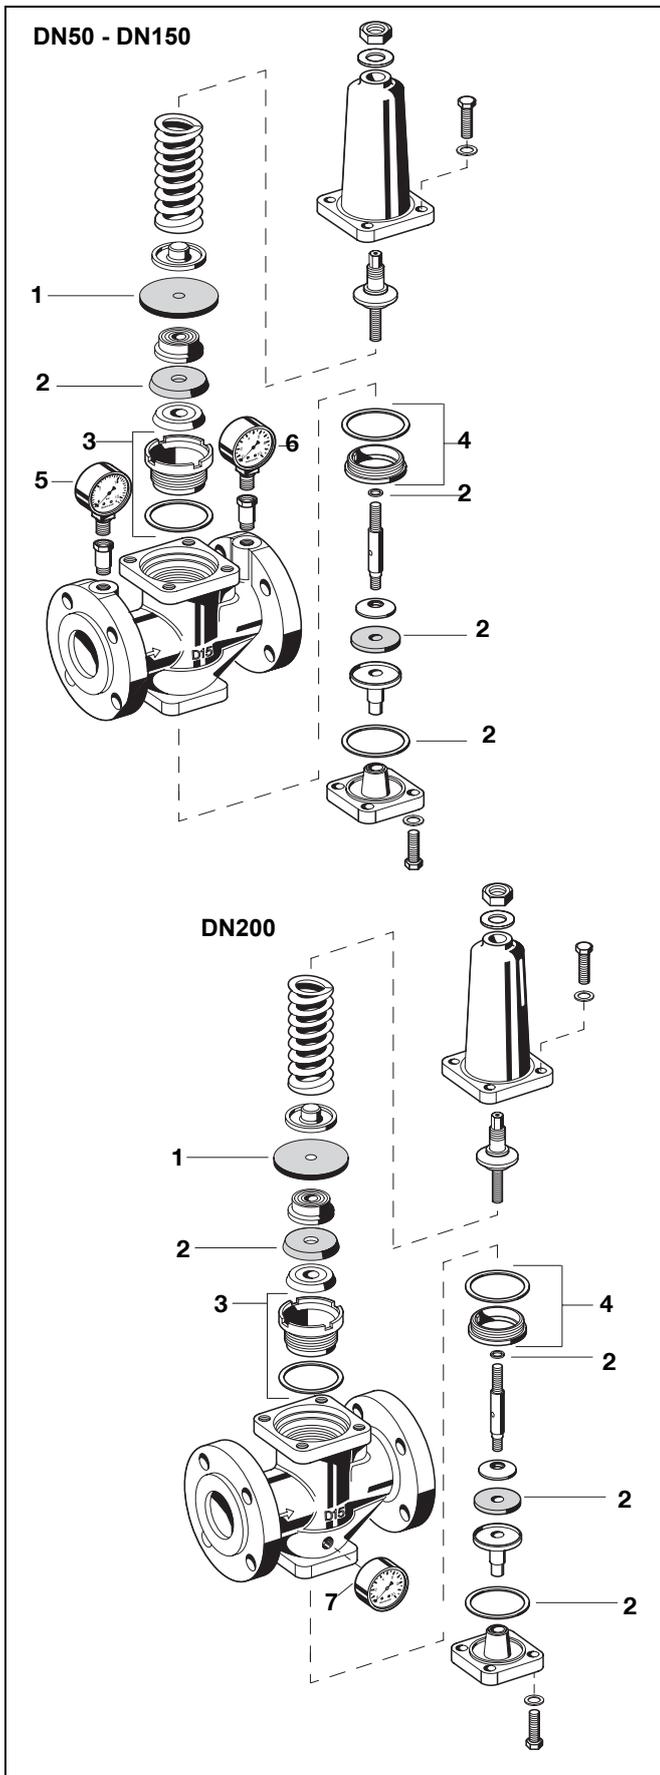

Pressure reducing valves should be installed:

- If the static pressure exceeds the maximum permissible value for the system
- If several pressure zones are required when a pressurisation system is used (pressure reducers on each storey of a building)
- If pressure fluctuations in the downstream system must be avoided
- To achieve constant inlet and outlet pressures on pumped pressure boosting systems
- To reduce the water consumption

**Spare Parts**

**Pressure Reducing Valve D15P, from 2016 onwards**

No.	Description	Dimension	Part No.
1	Diaphragm	DN 50	5707300
2	Set of seals	DN 50	0901353
3	Guide bush with seal	DN 50	0900255
4	Seat bush with seal	DN 50	0900247
5	Pressure gauge		M39M-A16
	Ranges 0 - 16 bar		
6	Pressure gauge		M39M-A10
	Ranges 0 - 10 bar		
7	Pressure gauge		M07M-A10
	Ranges 0 - 10 bar		

**Pressure Reducing Valve D15P, up to 2015**
