DATA SHEET

T 3003 EN

Series 42 Self-operated Regulators · Type 42-24 and Type 42-28 Differential Pressure Regulators

With Type 2424/Type 2428 Actuator (closing) and balanced Type 2422 Valve

K (€ FII

Application

Differential pressure regulators for district heating systems, extended heating systems and industrial applications

Differential pressure set points Δp from 0.05 to 10 bar · Valves DN 15 to 250 ¹⁾ · Pressure rating PN 16 to 40 · Suitable for liquids and vapors ²⁾ from 5 to 350 °C as well as for air and non-flammable gases up to 80 °C

The valve closes when the differential pressure rises.

The regulators control the differential pressure according to the adjusted set point.

Special features

- Type 42-24: Set point adjustable in wide range
- Type 42-28: Fixed set point
- Low-noise, medium-controlled proportional regulator requiring little maintenance
- Suitable for circuit water, water/glycol mixtures, steam and air as well as other liquids, gases and vapors, provided ed these do not affect the characteristics of the operating diaphragm
- Valve body optionally available in cast iron, spheroidal graphite iron, cast steel, cast stainless steel or forged stainless steel
- Single-seated valve with a plug balanced by a stainless steel bellows or a diaphragm (DN 65 to 250)
- Particularly suitable for district heating supply networks

Versions

Differential pressure regulators for installation in the flow pipe and return flow pipe (see Fig. 5) · Flanged connections

- Type 42-24 (Fig. 1) · Type 2422 Valve · Balanced by a bellows DN 15 to 250 · Balanced by a diaphragm DN 65 to 250 · Type 2424 Actuator with adjustable set point
- Type 42-28 (Fig. 2). Type 2422 Valve · Balanced by a bellows DN 15 to 100 · Balanced by a diaphragm DN 65 to 100 · Type 2428 Actuator with fixed set point, adjusted to Δp = 0.2, 0.3, 0.4 or 0.5 bar

Fig. 1: Type 42-24 Differential Pressure Regulator

Fig. 2: Type 42-28 Differential Pressure Regulator

Accessories

Required accessories, such as compression-type fittings, needle valves, compensation chambers and control lines, are listed in Data Sheet ► T 3095.

Special versions

- ANSI and JIS versions on request
- Versions free of non-ferrous metal on request
- Actuator with two diaphragms
- Version for temperatures above 220 °C
- Version for deionized water
- Version for mineral oils which do not affect the characteristics of the FKM diaphragm; other oils on request
- Version for small flow rates · Valve with micro-trim with K_{VS} 0.001 to 0.04 or K_{VS} 0.1, 0.4 and 1 without pressure balancing
- Type 2422 Valve · DN 15 to 50 without pressure balancing
- Special set point 8 to 16 bar for valves ≤ DN 100 on request

Valves larger than DN 250 on request

²⁾ Version balanced by a bellows only

Principle of operation (Fig. 3)

The medium flows through the valve in the direction indicated by the arrow. The position of the valve plug (3) determines the differential pressure over the cross-sectional area released between the plug (3) and seat (2).

The Type 2422 Valve is balanced. The forces acting on the valve plug created by the upstream and downstream pressures are balanced by a balancing bellows (5) or balancing diaphragm (5.1). Regulators balanced by a bellows or a diaphragm only differ in the pressure balancing principle applied. Valves balanced by a diaphragm have a balancing diaphragm (5.1) instead of the balancing bellows. The downstream pressure p_2 acts on the bottom of the diaphragm and the upstream pressure p_1 on the top of the diaphragm. As a result, the forces created by the upstream and downstream pressures acting on the plug are balanced out.

The differential pressure to be controlled is transferred to the operating diaphragm (13) where it is transformed into a posi-

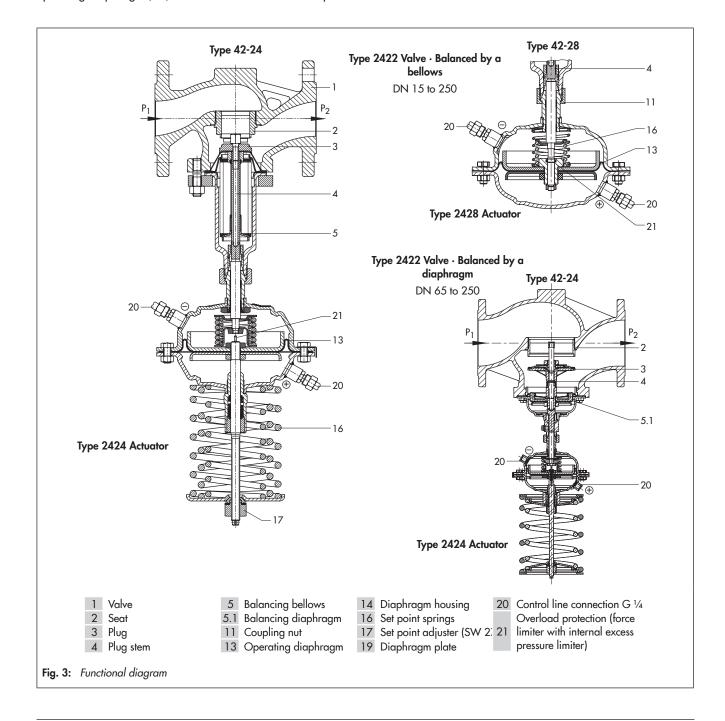

tioning force. This force is used to move the plug (3) according to the force of the set point springs (16). The valve begins to close as soon as the differential pressure exceeds the set point.

The set point of Type 42-24 can be adjusted at the set point adjuster (SW 27, 17). In Type 42-28, the set point springs in the actuator determines the set point.

A seal in the actuator separates the pressure in the valve from the pressure in the actuator.

Control lines (20) mounted on site transfer the high pressure (+) and low pressure (-) in both regulator versions.

Type 2424 and Type 2428 Actuators are equipped with an overload protection (21). It prevents a rise in differential pressure during extreme operating conditions (e.g. vacuum at the heat exchanger) by opening an internal excess pressure limiter. As a result, plants and the regulator itself are protected against excessively high differential pressures.

Type 42-24 Differential Pressure Regulator with two diaphragms

SAMSON offers a special version of Type 42-24 with an actuator with two diaphragms (see Fig. 4). The actuator with two diaphragms provides increased functional reliability.

An actuator with two diaphragms is always required when an FKM diaphragm is to be used. It is especially suitable for applications with thin oils (e.g. heat transfer oil).

The two diaphragms separate both diaphragm chambers connected to the high-pressure and low-pressure connections. They generate a positioning force from the differential pressure. A mechanical diaphragm rupture indicator (22) is located between the two diaphragms, which responds at approx. 1.5 bar. In the event of a diaphragm rupture, the pressure in the space between the two operating diaphragm starts to increase. This causes the pin in the diaphragm rupture indicator to be pushed outwards and a red ring appears, indicating the diaphragm rupture. The intact operating diaphragm takes on the control task of the ruptured diaphragm.

A pressure switch can be optionally mounted to the actuator to trigger an alarm.

We recommend replacing both diaphragms after a diaphragm rupture is indicated.

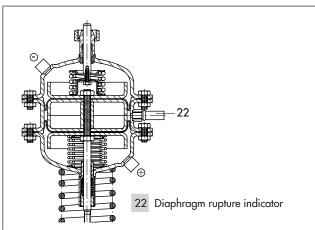

Fig. 4: Actuator with two diaphragms for Type 42-24 (special

Installing the valve and mounting the actuator

Valve, actuator and control lines (accessories) are delivered unattached.

A coupling nut is used to attach the actuator to the valve. Preferably mount the actuator after the valve is installed.

The following points must be observed:

- Install the valve in horizontal pipelines.
- The direction of flow must match the direction indicated by the arrow on the body.
- Install a strainer (e.g. SAMSON Type 2 NI) upstream of the valve.

Permissible mounting positions

- Actuator suspended: standard installation, balanced by a bellows or diaphragm, all versions, above 80 °C. Steam control only for version with balanced by a bellows.
- Actuator sideways: versions balanced by a bellows with fixed plug guide or all versions balanced by a diaphragm
- Actuator upright (actuator on top of the valve): all versions balanced by a diaphragm, versions balanced by a bellows DN 15 to 80 and at the same time max. 80 $^{\circ}$ C

Refer to ► EB 3003 for more details.
